

## **Hidden Photos Management**

We all know the “hidden photos” feature on our phone’s gallery, this option is so interesting yet doesn’t have a feature that helps manage all these photos and gets messy. So, I had come up with this research proposal which aims to address the challenges faced by users in managing hidden photos within Android gallery apps. My study will try addressing existing limitations, user challenges and potential privacy concerns related to this feature.

The objective is to explore various methods, including third-party apps, file managers, password-protected apps, cloud storage, and encryption techniques, to assess their effectiveness in providing users with secure and organized hidden photo collections.

Inspired by a conversation between me and\_\_ my friends, highlighting frustrations and privacy concerns about disorganized hidden photos on Android devices, this proposal introduces a user-centric approach. The focus is on enhancing the internal management of hidden photos by leveraging Android's built-in features. Specifically, the research will explore the Secure Folder functionality available on Android (ex: Samsung devices) and the organizational capabilities of Google Photos. this research aims to provide a seamless and secure solution for organizing hidden photos, emphasizing user satisfaction and privacy.
